RESULTS

Nausea and vomiting were the most frequent TEAEs in all 3 treatment groups

Omadacycline: Nausea and vomiting were consistent with the known profile of the tetracycline class

DISCUSSION

The data demonstrate that OMC is safe and well-tolerated.

Comparisons were made with the referent treatment group (Linezolid) from OASIS-2 study, when the subjects received a “loading dose” of OMC (150 mg).

Dyspepsia was the most frequent GI TEAE leading to the discontinuation of the study drug.

Conclusions

The authors wish to thank the subjects and investigators involved in this study.
